

PetroPro

Fuel Station Management Platform

User Guide

A walkthrough of every screen and feature — for station owners, managers, cashiers, and pump attendants.

Contents

- 1. Getting Started — logging in and portals
- 2. Dashboard — Station Control Center
- 3. Billing — creating a walk-in bill
- 4. Cashier Queue — settling attendant entries
- 5. Attendant Screen — pump-side entry
- 6. Catalog — items and groups
- 7. Customers — ledger and credit
- 8. Purchases and Rate Changes
- 9. Reports
- 10. Settings — station configuration
- 11. Users, Shifts and Audit Logs
- 12. Appearance — theme and colors
- 13. Tips and troubleshooting

1. Getting Started

Logging in

Open the app in a browser and go to the login page. Enter your User ID and password. What you see after logging in depends on your role — the app is organized into four portals:

Super Admin

Full access — station configuration, user accounts, backups, and everything below.

Owner

Business oversight — reports, catalog, customers, purchases, rate changes. No user management.

Operator

Day-to-day billing — walk-in billing, the cashier queue, customer lookups.

Field Operator

Pump-side entry — the attendant screen only.

Finding your way around

Once logged in, the sidebar on the left lists everything your role can access, grouped the same way the original paper-based menu was organized: Maintenance, Bill, Reports, Search, and Utilities. The header bar at the top shows the station's own letterhead (name, "Dealers of IOCL", address) in the middle, and your name, role, and a Sign Out button on the right.

2. Dashboard — Station Control Center

Available to Super Admin and Owner. This is the landing page for a quick, at-a-glance view of how the station is doing right now.

- Today's Sales, Bills Today, Pending Queue, and Customer Dues — four key numbers, updated live.
- Last 5 Sales — the most recent completed bills, in a simple table.
- Sales trend — a bar chart of revenue over the last 7 days.
- Low stock — any item running below the safety threshold, flagged in red.
- Top customer dues — the five customers owing the most.
- Shift status — who currently has a cash drawer open.
- Recent purchases and recent activity — a quick audit trail.
- "Big screen" button (top right) — enlarges everything for viewing from across a room, e.g. an office TV or lobby display.

A few widgets (live pump status, tank fill gauges, weather, AI insights) are shown as clearly labeled "Not yet connected" placeholders rather than invented numbers — they need hardware or external integrations this deployment doesn't have yet.

3. Billing — Creating a Walk-in Bill

Available to Super Admin, Owner, and Operator. This is where most day-to-day sales are entered.

Steps

- 1. Choose a payment type: Cash, UPI, Card, or Credit.
- 2. If Credit, enter the customer code (type to search) — their due amount and credit limit appear automatically.
- 3. Optionally enter a vehicle number, a pump, and (for credit sales) an order number.
- 4. Add line items: pick an item, then enter either a quantity or an amount — whichever you type, the other fills in automatically from the item's rate. Click Add.
- 5. Use Save to record the bill, or Save and Print to record it and immediately open the printable invoice.

UPI payments

Selecting UPI shows the station's own payment QR code on screen (set up once in Settings) so the customer can scan and pay with any UPI app. There's no payment gateway behind this — after the customer pays, you tick "Customer has paid — confirmed" yourself before the bill can be saved.

Other actions

- Save as draft — sets the current bill aside (without submitting it) so you can start a new one; resume it later from the Draft Queue at the top of the page.
- Reset — clears just the item/quantity you're currently typing, without touching lines already added.
- Cancel — discards the entire in-progress bill (asks for confirmation first).
- Look up / cancel a bill — find any bill by number, view or print it, and (Super Admin/Owner only) cancel it.
- Last 3 Bills and Recent Bills — quick-reference tables at the bottom of the page.

4. Cashier Queue — Settling Attendant Entries

Available to Super Admin, Owner, and Operator. When a pump attendant logs fuel dispensed without collecting payment themselves, it lands here as a pending entry.

- Click a pending entry to select it, or click Print next to it for a reference slip (not a tax invoice — the customer hasn't paid yet).
- Optionally add extra items (lubricants, accessories) to the same bill.
- Choose the payment type — Cash, UPI, Card, or Credit — and confirm UPI payment the same way as on the Billing screen.
- Click "Accept payment & print bill" to turn the pending entry into a real, paid invoice.

5. Attendant Screen — Pump-Side Entry

Available to Field Operator accounts (and Super Admin/Owner). Designed for a phone or tablet at the pump.

Two modes

- Send to cashier — the original flow: enter vehicle, pump, item, quantity, and optional odometer, then send it to the Cashier Queue for someone else to collect payment. Works offline — if the connection drops, entries queue locally and sync automatically once it's back.
- Settle now — lets the attendant accept payment directly (Cash, UPI, or Card only — not Credit) and complete the sale on the spot, without a cashier handoff.

Printing

- In "Send to cashier" mode: a "Print pump slip" button appears after sending — an informal receipt, clearly marked as not a tax invoice, using whatever printer is set up on the device (including a WiFi printer).
- In "Settle now" mode: a "Print Bill" button appears — the real invoice, since a real bill now exists.

6. Catalog — Items and Groups

Available to Super Admin and Owner. Manage the product list: fuel, lubricants, and any other items sold, organized into groups.

- Groups — simple code + name categories (e.g. Fuel, Lubricant).
- Items — code, name, group, wholesale/retail price, purchase value, tax %, and whether the item tracks mileage (used for fuel items on vehicle mileage reports).

7. Customers — Ledger and Credit

Available to Super Admin, Owner, and Operator (ledger view restricted to Super Admin/Owner).

- Maintain customer records: code, name, address, phone, credit limit, service charge, GST number.
- View a full ledger per customer — opening balance, every bill and receipt, running balance.
- Record receipts against a customer's account, with printable receipts.

8. Purchases and Rate Changes

Both available to Super Admin and Owner.

Purchases

Record stock received from suppliers — item, quantity, value, invoice number. Feeds directly into the stock day-book.

Rate Changes

Schedule a new price for an item to take effect on a future date, or apply changes that are already due. Pending changes can be retracted before they're applied.

9. Reports

Available to Super Admin and Owner. One screen, switchable between report types:

- Sales — by item, by cashier, or by group, for any date range and granularity (daily/monthly/yearly).
- Bill register — every bill in a date range, with status.
- Stock report, purchase report — day-book detail for a date range, optionally filtered to one item.
- Customer ledger, vehicle sales, fleet-card sales, mileage report.
- GST summary — tax collected by rate, exportable to Excel.

10. Settings — Station Configuration

Most sections here are Super Admin/Owner; a few (marked below) are Super Admin only.

- Tenant / Company Profile — station name, address, GST number, and the Payment QR Code shown for UPI sales.
- Pumps — how many pumps the station has and what they're called; shown as a picker on the Attendant and Billing screens.
- Operational Settings (Super Admin only to change) — legacy operational flags.
- Financial Year — the current financial year's start date.
- Bulk Tax Change — revise the GST rate across a whole product group, or every item at once.
- Backup & Restore (Super Admin only) — take a snapshot of the database at any time, or restore an earlier one.
- Go-Live Reset (Super Admin only) — for switching from demo/reference data to real day-one operation: clears all bills, stock movements, purchases, receipts, the pending queue, shifts and the audit log, resets customer dues to zero, and restarts bill numbering from 1. A backup is taken automatically first. The catalog, customers, pumps, tenant details and user accounts are not touched.

11. Users, Shifts, and Audit Logs

Users (Super Admin only)

Create, edit, deactivate, or reset the password of any account. New accounts and password resets get a temporary password shown once — pass it on to that person yourself.

Shifts

Open and close a cash-drawer shift. Closing reconciles counted cash against what the system expects from cash sales made during the shift, and reports any variance.

Audit Logs

A running record of who did what — user management, settings changes, bill cancellations, backups, and more. Available to Super Admin and Owner.

12. Appearance — Theme and Colors

Two independent choices, both available from the header bar, and both remembered per browser:

- Light / dark mode — the sun/moon icon.
- Color style — the palette icon, with five options: Neutral (default), Tinted cards, Header bars, Vibrant sidebar, and Bold everywhere. Try each and pick whichever looks best.

13. Tips and Troubleshooting

- The attendant–cashier handoff is deliberate: an attendant logs fuel dispensed, a cashier collects payment. "Settle now" on the Attendant screen is the exception — a direct sale with no handoff.
- UPI payments always need a manual confirmation tick — there's no payment gateway behind it, so double-check the payment actually arrived before confirming.
- Credit sales are never available to Field Operator accounts, even in "Settle now" mode — those always need a cashier or the billing screen, where the customer's credit limit can be checked.
- If a stock day has been closed (Settings or reports), no further sales or receipts can post against that date — this is intentional, to stop backdated entries after a day is finalized.
- Not sure which report to use? Start from the Dashboard — every number there links conceptually to a fuller report of the same data.
