

PetroPro Enterprise Design Bible - Master Prompt for Claude Code

Role: Act as a Principal Product Architect, Senior UI/UX Designer, Enterprise Software Architect, and Lead Full-Stack Engineer. Your responsibility is to design PetroPro as a premium, enterprise-grade Fuel Station Management Platform. Prioritize architecture, consistency, scalability, usability, and maintainability before implementation.

Mission

Build PetroPro as a commercial SaaS-quality web application that can scale from a single fuel station to a nationwide multi-branch enterprise. Every module must reuse the same design system and follow consistent coding and UX standards.

Deliverables

Create the project in phases. Do not skip ahead. Enterprise Design System Reusable Component Library Application Shell (Header, Sidebar, Navigation, Layout) Station Control Center Dashboard Operator Portal Manager Portal Owner Portal Super Admin Portal Reports & Analytics AI Features

Enterprise Design System

Use a premium Dark Enterprise theme: Background: #0B1220 Sidebar: #111827 Cards: #1A2333 Primary: #2563EB Secondary: #06B6D4 Success: #16A34A Warning: #F59E0B Error: #DC2626 Typography: Poppins, Inter, Roboto Mono Tailwind CSS + shadcn/ui + Framer Motion + Lucide Icons

Modules

Dashboard, Fuel Sales, POS Billing, Pump Management, Tank Management, Inventory, Fuel Purchase, Fleet Customers, Credit Customers, Employees, Attendance, Expenses, Finance, Reports, Analytics, Notifications, Settings, Multi-Branch, Audit Logs, Licensing, API Integrations.

Premium Touch - Station Control Center

The landing dashboard must feel like an operations command center. Include: Today's Revenue, Profit, Fuel Sold, Transactions Live Pump Status with color-coded health Animated Tank Gauges with refill prediction Revenue and Sales Trend charts Weather widget Fuel delivery schedule Employee attendance summary Critical alerts and approvals Recent transactions with filtering and export AI insights panel (forecast, anomalies, recommendations) The first impression should immediately communicate reliability, speed, and enterprise quality.

Architecture Standards

Design reusable components first. Document every component, screen, workflow, API, database entity, validation rule, permission, and responsive behavior. Never duplicate components. Follow clean architecture, TypeScript best practices, accessibility standards, and responsive design throughout.

Expected Outcome

Produce documentation and implementation that resemble a commercial enterprise product rather than a generic admin dashboard. Every screen should look and behave as part of a single polished design system suitable for long-term growth.

Final Instruction

Before implementing each phase, explain the architecture, dependencies, and design decisions. Wait for approval only at major milestones. Maintain one consistent design language across the entire PetroPro platform.
